Exceptions are indicated by an explicit note.

Exceptions are indicated by an explicit note.

IMPORTANT: This sequence is NOT necessarily the entire insert of important and clone. It may be shorter because we only sequence the specified clone. It may be shorter because we arrange for a small overlap between neighbouring submissions.

It may be shorter because we only sequence overlapping sections once, or longer because we arrange for a small overlap between because we arrange for a small overlap between
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Submitted (27-APR-1995) Louis, MO 63110, USA.                                                                                                                                                                                                                                      overlap between neighbouring submissions.

This sequence is the entire insert of clone F53F1. The true right end of clone M04G12 is at 21759 in this sequence. The start of this sequence (1. .101) overlaps with the end of sequence Z81103.

The end of this sequence (39379. .39478) overlaps with the start of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Current sequence finishing criteria for the C. elegans genome sequencing consortium are that all bases are either sequenced unambiguously on both strands, or on a single strand with both a dye primer and dye terminator reaction, from distinct subclones. Exceptions are indicated by an explicit note.

IMPORTANT: This sequence is NOT necessarily the entire insert of the specified clone. It may be shorter because we only sequence overlapping sections once, or longer because we arrange for a small content of the specific of the specific of the specific of the specific clone.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Direct Submission

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Wilson, R., Aliscough, R., Anderson, K., Baynes, C., Berks, M., Bonfield, J., Burton, J., Connell, M., Copsey, T., Cooper, J., Coulson, A., Craxton, M., Dear, S., Du, Z., Durbin, R., Favello, A., Fulton, L., Gardner, A., Green, P., Hawkins, T., Hillier, L., Jier, M., Johnston, L., Jones, M., Kershaw, J., Kirsten, J., Laister, N., Latreille, P., Lightning, J., Lloyd, C., McMurray, A., Mortimore, B., O'Callaghan, M., Parsons, J., Percy, C., Rifken, L., Roopra, A., Saunders, D., Shownkeen, R., Smaldon, N., Smith, A., Sonnhammer, E., Staden, R., Sulston, J., Thierry Mieg, J., Thomas, K., Vaudin, M., Vaughan, K., Waterston, R., Watson, A., Weinstock, L., Waterston, J. and Wohldman, P.
                                                      Current sequence finishing criteria for the C. elegans genome sequencing consortium are that all bases are either sequenced unambiguously on both strands, or on a single strand with both a dye primer and dye terminator reaction, from distinct subclones. Exceptions are indicated by an explicit note. INPORTANT: This sequence is NOT necessarily the entire insert of the specified clone. It may be shorter because we only sequence overlapping sections once, or longer because we arrange for a small

Current sequence finishing criteria for the C. elegans genome
sequencing consortium are that all bases are either sequenced
sequencing consortium are that all bases are either sequenced
unambiguously on both strands, or on a single strand with both a
dye primer and dye terminator reaction, from distinct subclones.
Exceptions are indicated by an explicit note.
Exceptions are indicated by an explicit note.
Important: This sequence is NOT nocessarily the entire insert of
the specified clone. It may be shorter because we arrange for a small
overlapping sections once, or longer because we arrange for sections
overlap between neighbouring submissions.
It may be shorter because we only sequence overlapping sections
once, or longer because we arrange for a small overlap between
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Bonfield, J., Burton, J., Connell, M., Copsey, T., Cooper, J., Coulson, A., Craxton, M., Dear, S., Du, Z., Durbin, R., Favello, A., Culson, A., Cardner, A., Green, P., Hawkins, T., Hillier, L., Jier, M., Johnston, L., Jones, M., Kershaw, J., Kirsten, J., Laister, N., Latreille, P., Lightning, J., Lloyd, C., McMurray, A., Mortimore, B., O'Callaghan, M., Parsons, J., Percy, C., Rifken, L., Roopra, A., O'Callaghan, Shownkeen, R., Smaldon, N., Smith, A., Sonnhammer, E., Sanden, R., Sulston, J., Thierry-Mieg, J., Thomas, K., Vaudin, M., Vaughan, K., Waterston, R., Watson, A., Weinstock, L., Walkinson-Sproat, J. and Wohldman, P., Walkinson-Sproat, J. and Wohldman, P.

Current sequence finishing criteria for the C. elegans genome
sequencing consortium are that all bases are either sequenced
unambiguously on both strands, or on a single strand with both a
dye primer and dye terminator reaction, from distinct subclones.
Exceptions are indicated by an explicit note.
Exceptions are indicated by an explicit note of the specified clone. It may be shorter because we only sequence
overlapping sections once, or longer because we arrange for a smal
overlap between neighbouring submissions.

                                                                                                                                                               PS Claim 20; Fig 1A-E; 69pp; French.

Crhis sequence corresponds to the genomic sequence encoding a Plasmodium crhis sequence corresponds to the genomic sequence encoding a Plasmodium craim (W24790). The gene sequence was isolated by screening a CP. falciparum strain T9/96 library with the serum from a missionary created by prophylaxis (for strain T6/96 see FR9101286). Of 20 clones cisolated, clone 729s was used to screen a library generated from Thai created by prophylaxis (for strain T6/96 see FR9101286). Of 20 clones cisolated, clone 729s was used to screen a library generated from Thai created here. The gene contained a 6.85 kb insert including the sequence created here. The gene organisation comprises a first exon, a short created here. The gene organisation comprises a first exon, a short created here. The gene organisation comprises a first exon, a short created here. The gene organisation comprises a first exon, a short created from the containing a 1.8 kb region encoding created from the second exon containing a 1.8 kb region encoding created from the lisation membrane anchoring created from the lisation of the second exon polypeptides of at least 10 created was vaccines for immunotherapy of malaria.

        Duffy antigen binding protein (DABP) and stalic acid binding protein (SABP) conserved regions (see T72889 and T72888 respectively). The var family of genes modulate cytoadherence and antigenic variation of plasmodium infected erythrocytes. SABP and the Duffy antigen binding protein (DABP) are soluble proteins that appear in the culture supernatant after infected erythrocytes release merozoites. DABP and SABP mediate the binding of merozoites and schizonts to the erythrocyte surface. This sequence can be used in the compositions of the invention. The compositions are for the treatment and prevention of malaria, and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                var-1, var-2, var-3 or var-7 genes of the DBL gene family, a family of genes having homology with conserved regions of DABP and SABP. The compositions are used for the treatment and prevention of malaria. They are also used in the preparation of vaccines for inducing a protective immune response in a mammal to Plasmodium merozoites (especially plasmodium falciparum or plasmodium vivax).
